Document: New SedonaOffice Guide
Date: October 30, 2026
Author: SM/sjt
Distribution: Sedona Users

SedonaOffice has been upgraded to the latest version and moved to our new server environment. The new environment utilizes a different method to access Sedona. Instead of running the application directly from your workstation, you will access it through your web browser. This will provide a more consistent and secure experience whether you are working in the office or remotely.

There are three notable changes:

- You will now access SedonaOffice through your browser.
- Printing has been configured via our new Print Server infrastructure. You may need to choose a printer for the first print.
- The document attachment process has changed because users will now access Sedona though an application server (instead of the application installed on your local device).

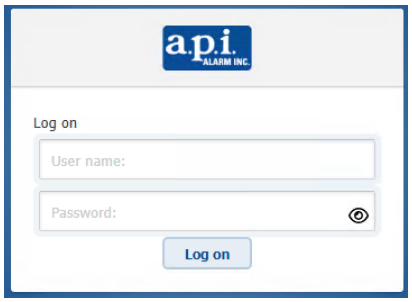

Below are instructions for accessing the new SedonaOffice environment, as well as the updated procedures for printing, and transferring/attaching files.

Accessing SedonaOffice

Open a web browser and go to: Https://access.apialarm.com

Access is available only while connected to the API (wired) office network or (if working remotely) via VPN.

You will be presented with the login screen shown below:

Log in using the **same username and password that you currently use to sign in to your work computer** (ie/ John.smith). After signing in, you will be presented with an application launch screen. Select **SedonaOffice**. SedonaOffice will then open directly within your browser in a full application window.

Login with your Sedona username and password. (Please remember usernames are case-sensitive so use all lowercase (firstname.lastname).

Printing From New SedonaOffice

Network printers are available within the new SedonaOffice environment. When printing from SedonaOffice, select the appropriate network printer from the available printer list as normal. If you don't see the printer you require in the list, please submit a ticket and the IT team will review adding it.

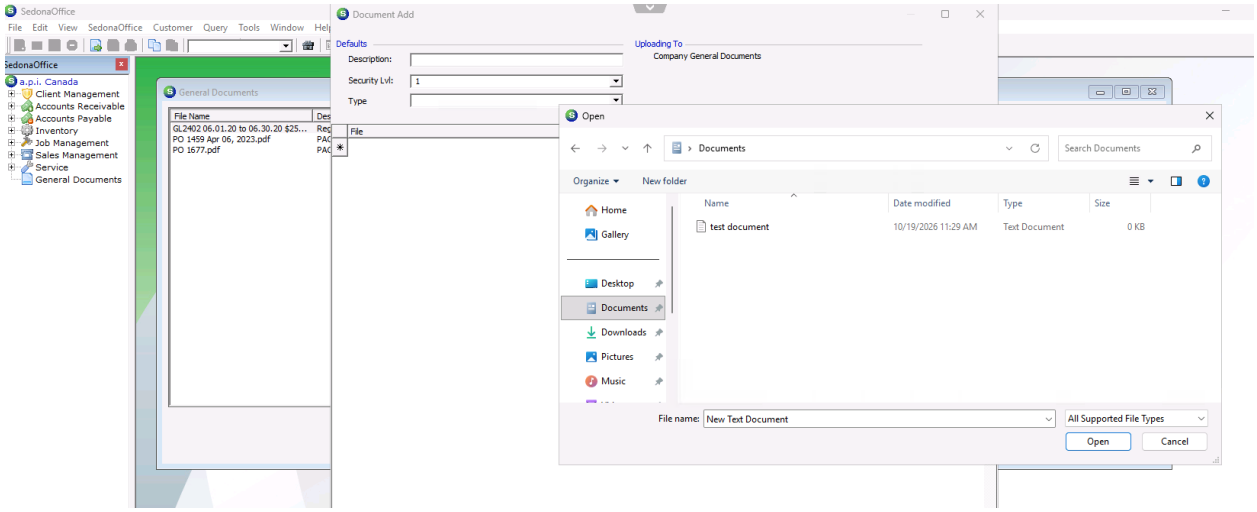

Uploading/Attaching Files In New SedonaOffice

In the new environment, files on your local computer first need to be uploaded before SedonaOffice can access them. You do this by selecting the **upload/cloud arrow icon** (shown below) from the small toolbar located at the top-centre of your browser window.

Select the image or document you wish to attach from your computer. Once the file uploads, it will be placed in the **Documents** folder within your SedonaOffice session.

When SedonaOffice prompts you to **browse** for or **attach** a document, open the **Documents** folder and the uploaded file will be available there (see below).

Changes Overview

- SedonaOffice will be upgraded to the latest version.
- You will access SedonaOffice through your browser instead of launching it locally.
- You can access it only from the office or remotely through the VPN.
- Printing will continue to be available through network printers configured in the new environment.
- Files from your computer can be transferred into your SedonaOffice session using the upload button, for attachment.

These subtle changes in the way you interact with Sedona are necessary for API to provide improved performance, reliability, capacity and security. Other than the above changes, the application itself remains identical to what you're familiar with.

If you encounter any issues regarding the new SedonaOffice environment, you can submit a ticket in the IT Support Portal (https://hudsontechnology.itclientportal.com/)

Thank you for your cooperation!
